Doctor workflow review

Public/simulated cases only. This packet records usability feedback; it does not establish clinical effectiveness.

Review status

Pending. Fill reviewer role, date, software/model version, monitoring hours, assigned reviewer, expected response delay and escalation owner after actual review.

Intended workflow

Adult Type 2 diabetes. A staffed care team reviews predicted high-glucose excursions and data-quality issues. Primary research target: any measured glucose above 180 mg/dL within 30 minutes. Sixty-minute results are separate. No automated treatment or medication instructions.

Operating point to review

Initial engineering budget: one false-alert episode per 24 eligible forecast hours. Clinical acceptance, escalation rules and staffing requirements require the doctor's input.

Case	Task / observation
Advance warning	Find issue time, predicted event, input history and eventual observed outcome.
Stable patient	Explain what a low probability does and does not establish.
Sensor gap	Find last reading and explain why forecasts are paused.
Uncertain prediction	Inspect interval, adaptation maturity and recent errors.
Misleading prediction	Find an actual false alarm or missed episode and document a next step.

Record the feedback

Complete this page after each session. Do not mark an unperformed task as passed.

Field	Response
Reviewer role / review date	_____
Software / model version	_____
Monitoring hours / reviewer	_____
Response / escalation ownership	_____
Alert burden acceptable? Why?	_____

Per-case findings

Case	Completed / time	Misunderstanding / change
Warning	_____	_____
Stable	_____	_____
Gap	_____	_____
Uncertain	_____	_____
Misleading	_____	_____

Second review

Repeat failed tasks after revisions. Check outside-hours operation, duplicate readings, historical context arriving late, and acknowledgement having no influence on prediction accuracy.

Release decision

Workflow feedback completed: _____. Critical misunderstandings resolved: _____. Clinical-use approval remains a separate process. Keep identifying reviewer details private unless publication was agreed.
